

Keyboards and Mice: The keyboard isn't responding, but I can move the mouse. What do I do?

Did you spill something in the keyboard? I know that sounds silly, but it has happened in the past.....

Next, check the cables. Make sure BOTH ENDS of the keyboard and mouse cables are plugged in and not loose.

If the keyboard is USB (flat connector, not round like ADB), disconnect and reconnect it. This may force the machine to reinitialize the connection.

If the cables check out, then the application is probably frozen. See [The application I'm in isn't responding. What do I do?](#)
